Profile

Analytical and detail-oriented Data Science professional with a B. Tech in Mechanical Engineering and certifications in Full Stack Data Science & AI (AlmaBetter & IIT Guwahati). Experienced in data analysis, visualization, market research, and business communication. Proven ability to contribute to strategic projects across operations, sales and product analytics. Proficient in Python, SQL, Excel, Tableau, Power BI. A collaborative team player with strong time management and adaptability skills.

Core Competencies

• Python, SQL, Pandas, NumPy, Scikit-learn, NLP, Statistics

• Data Analysis, Data Visualization, Machine Learning

• Microsoft Excel, Tableau, Power BI, Seaborn, Matplotlib

• Gen AI (Prompt Engineering + Dall E using ChatGPT + Midjourney)

• **Tools & IDEs:** Visual Studio Code, PyCharm, Jupyter Notebook, Google Colab, Git, GitHub

• Strategic Thinking, Market Research

• English & Hindi Proficiency (Spoken & Written)

Work Experience

Data Science Trainee – AlmaBetter (Bootcamp)
Mar 2022 – Dec 2023

Completed end-to-end data science projects with business storytelling

Presented insights using project explanatory video with insights drawn on ppt or pdf format.

Data Science Trainee | Cognifyz Technologies
Mar 2025 – May 2025

Understand the restaurant business model worldwide with Data Exploration and Visualization. Predictive Modelling to build ML Model and analyze the Customer Behavior

Data Science Trainee | Unified Mentor
May 2025 – Nov 2025

Build live project using Data Analysis and advance machine learning concept.

AI Trainee Engineer | Arcap Reit
July 2025 – Present

Learn the Data Science and AI concept in heathcare, manufacturing and robotics fields.

Execute the client project.

Certification

1. Full Stack Data Science and AI (AlmaBetter)
2. Advanced Certification in Full Stack DS & AI (IIT Guwahati)
3. AI tools Certificate – Be10x
4. Python Basic – HackerRank

Education
B. Tech (Mechanical Engineering) – 75%
BIET Jhansi (2017)

Highschool – 82% Intermediate – 86%

Project Work – AlmaBetter

Airbnb Booking Data Analysis link
Python, Pandas, Matplotlib, Seaborn, Tableau

1. Conducted **Exploratory Data Analysis (EDA)** to identify key factors affecting pricing, location trends, and host behavior.
2. Visualized insights using **Tableau dashboards**, helping highlight patterns in booking frequency and seasonal demand.
3. Improved interpretability by cleaning and preprocessing raw data for better analytical accuracy.

Capstone Project - Retail Sales Prediction link
Python, Scikit-learn, Pandas, Matplotlib
1. Explore the sales data for 1,115 Rossmann stores and predict the demand using by using data preprocessing, cleaning the data, feature engineering etc.
2. Build the Supervised machine learning Algorithm **regression model** which is feasible in forecasting the future demand based on store type, promotions, and holidays.
3. Conducted **feature engineering** and model evaluation using **RMSE** and **R^2 metrics** for performance measurement.

Product Dissection with ER diagram link

1. Performed Market Research on various strategy by Domino's Pizza to dominate on global scale.
2. Built an Entity Relationship Diagram with Primary Key and Foreign Key structure in SQL format

Customer Purchase Behaviour Analysis link

Python, Pandas, Seaborn, Matplotlib

1. Performed **EDA** and segmentation on customer transaction data to identify high-value customers and purchasing patterns.

2. Complemented regression models to predict retail trends and revenue cycles

Project Work – Unified Mentor

COVID-19 Clinical Trials Data Exploration link

Python, NumPy, Matplotlib, Seaborn

- Analyzed global **COVID-19 clinical trial data** to study research distribution, sponsor participation, and trial status.
- Applied statistical analysis and data visualization techniques to identify the most active regions and institutions in research efforts.
- Presented findings through charts and summary tables to support health policy insights.

Regulatory Affairs of Road Accident Data 2020 India EDA link

Python, Pandas, Seaborn, Scikit-learn, Matplotlib

The goal is to analyze the causes of road accidents in million-plus cities in India, identify patterns in causes and outcomes, and visualize the distribution of accidents based on different categories.

Netflix Content Analysis and Recommendation System link

Python, Pandas, Seaborn, Scikit-learn, PostgreSQL, Power BI

- Performed **EDA** on the Netflix dataset to uncover trends by genre, release year, and country using Python visualization libraries.
- Built a **content-based recommendation system** using **TF-IDF Vectorization** and **Cosine Similarity** to suggest similar titles based on genre and cast features.
- Designed an interactive **Power BI dashboard** highlighting popular genres, yearly content growth, and country-wise distribution.
- Utilized **PostgreSQL** for querying and deriving insights such as *"Which country produces the most content?"* and *"What's the average duration of shows vs. movies?"*.

Customer Satisfaction Prediction | Machine Learning Project link

Developed a predictive model to forecast customer satisfaction using historical support ticket data. Performed extensive data cleaning, feature engineering, and text analysis to extract key insights. Trained and evaluated multiple models (XGBoost, Random Forest, Neural Network) using accuracy and classification metrics. Identified top factors influencing satisfaction, enabling proactive interventions and improved service quality.

Exploratory Data Analysis of Google Play Store Apps link

- Cleaned and analyzed 10K+ app records from Google Play Store to uncover factors influencing app ratings and installs.
- Conducted EDA (univariate, bivariate, multivariate) to explore trends such as Category-wise distribution, Free vs Paid apps, and Rating vs Installs.
- Performed **sentiment analysis** on 60K+ user reviews to measure polarity and subjectivity, identifying key drivers of user satisfaction.
- Delivered actionable insights that could **improve app engagement by ~20%** through better targeting of app categories and pricing models.

Key Insight: Found that app category, size, and sentiment polarity strongly correlate with app ratings and install volumes, providing strategic guidance for app developers

Tobacco Use and Mortality (2004–2015) – Data Science | Machine Learning link

Developed a predictive model to analyze the relationship between tobacco use and mortality trends from 2004–2015 using datasets from WHO and CDC. Performed data cleaning, feature engineering, and EDA using Python and SQL. Built and optimized models (Logistic Regression, Random Forest, XGBoost) achieving 85% accuracy. Interpreted model outputs with SHAP/LIME and deployed results via a Flask API and Streamlit dashboard, uncovering key mortality risk factors such as age, tobacco frequency, and socioeconomic conditions.

Key Insights & Impact:

- Identified a **strong correlation between long-term tobacco use and higher mortality rates** in adults aged 35+.
- Highlighted socioeconomic and healthcare access disparities influencing tobacco-related deaths.
- Provided insights that could assist in **public health interventions and awareness programs**.
